Measuring area with the school court

Learners compute the area of rectangles using the school basketball court and classroom floor tiles.

Fictional placeholder made by the CherIt team for a hackathon demonstration.

How big is our court?

Guess first: how many classrooms fit on the court?

Today we measure, then compute area = length x width.

Measure in groups

Group 1: length of the court (paces, then metres)

Group 2: width of the court

Group 3: one floor tile in the classroom

Compute and compare

Area of the court = length x width

How many tiles would cover the court?

Was your guess close?
